# Foreword

## 0.1 Preamble

This document houses all the codes I built on LilyPond since September 2024. Because I deal with contemporary notations in my compositional practice, I found myself creating codes and turning them into variables in order to repeatedly use them in my projects. I created a dedicated `.ly` file to store these codes for use, which quickly became very lengthy. I thought it would be useful to organize them into a document where I could easily consult and remind myself what they are and how to use them. This is that document.

Because I use LilyPond actively in my daily compositional and musical typesetting activities, this document is a work in progress.

## 0.2 README

This document and the codes contained herein are under the MIT License. So long as you include the copyright as well as the MIT License permission notices, please feel free to use my codes in your LilyPond files or modify them according to your specific need. Furthermore, crediting in the following manner is greatly appreciated:

```
% Original Code written by Yoshiaki Onishi  
% https://github.com/yoshiakionishi/lilypond-snippets
```

I make this document public because I wish to return something useful to the LilyPond community, but also to seek and implement any improvements other users may find in my codes. Please feel free to reach out to the email address shown on the title page of this document.

In the interest of making the codes found in this document available to as many people as possible, I have avoided using copyrighted musical examples. However, wherever appropriate, I have provided bibliographical sources. Furthermore, I acknowledge that, just as academic work in humanities goes, my ideas are built on those that are formulated by

others; as such, whenever there is a direct source of inspiration for formulating a code, I provide sources.

In creating this document, I make no claim that my notational choices represent an absolute standard that everyone should adhere to. Once the basic principles of notation and typesetting are established (e.g., avoiding collisions, etc.), notation becomes a personal decision for each composer, shaped by careful study of preexisting scores and an evaluation of their musical contexts.

For example, in his book *The Bass Clarinet – A Personal History*, Harry Sparnaay lists nine variants of noteheads for the slap tongue technique.<sup>1</sup> In my work, I created two subcategories of the slap tongue technique: one followed by a pitch and another followed by an air sound (which produces the slap tongue effect that sounds “empty”). To distinguish between the two, I decided to use encircled noteheads—both filled and hollow—and attribute them to each subcategory. Again, this is a method that I have found works for my music, but I would be reluctant to suggest that others should follow the same.<sup>2</sup>

Readers are encouraged to modify my codes in order to suit their desired techniques. This document serves as a record of how I arrived at certain notational choices, because learning LilyPond meant that I would also need to become familiar with Scheme, which proved to be somewhat challenging—even though I have used Common Lisp before owing to programming in OpenMusic—because I had to make many guessworks as I navigated various Scheme codes in other snippets available online. I have also gained familiarity in PostScript language as I continued to familiarize myself with LilyPond.<sup>3</sup>

## 0.3 Background

After [MakeMusic](#) announced that they would cease development of the music notation software program [Finale](#), which I had used for the past twenty-four years, I decided to explore a few other music notation programs to determine the best alternative. At the time of writing this document in late November 2024, a little under three months have passed since I started using [LilyPond](#) for my daily typesetting needs. I now open LilyPond more often than Finale and am committed to using it for the foreseeable future. LilyPond appears to me as the way forward both as a composer and a musical typesetter, as other proprietary notation programs, such as Dorico (which MakeMusic has claimed to be the leading program in the industry) and Sibelius, fall short of what I wish to accomplish.

While LilyPond is “just” a music notation software program that I happened to choose, it

---

1. Harry Sparnaay, *The Bass Clarinet: A Personal History* (Periferia Sheet Music, 2012), 66.

2. This particular notation becomes quickly problematic in terms of rhythmic notation when a bar is longer than a half note (e.g. 1/2, 2/4, 4/8...) For this reason, I tend to favor time signatures that avoids the use of a half note, such as 3/8 or 5/16.

3. See Appendix A for some resources I referred to for Scheme- and PostScript-related matters.

is, in a way, more than a toolkit for a composer. It appears that way to me, at least, because choosing an open-source platform with strong community support and engagement, rather than a proprietary program where desired functionality is subject to the priorities of a small group of salaried developers, reflects a critique of the capitalist/commercialist mindset that often pervades a composer's life.

For example, before transitioning to LilyPond, I briefly explored Dorico. However, as of late September 2024, its functionality for displaying straight flags was very limited; the angle of the straight flags provided by the software was too steep. I consulted the online forum and discovered that another user had posted a question similar to mine. The chief developer of Dorico responded to that post, noting that implementing improvements to this feature was possible but "not currently a high priority."<sup>4</sup> In this tiered structure typical of capitalism, composers may find themselves with increasingly limited creative "freedom."

MakeMusic has heavily advertised on social media platforms that Finale users should migrate to Dorico because it is the "next industry standard." However, this advertising seems to discourage thoughtful consideration of alternatives, leaving little room for reflection or exploration. I became increasingly disillusioned as I witnessed the coercion to invest in a program—however exciting it may appear—with no definite promise of its long-term security and stability.

Of course, it is not my intent to claim that all composers should abandon their proprietary programs of choice, particularly those they have invested money in and/or have been using for many years. It is, however, important to note that:

1. All proprietary programs are at the mercy of the executives who run the companies behind them. "Oh, [insert the name of a proprietary program] is operated by [insert the name of its company], and I just don't see them closing the program down," someone might say. Yet, it happened to Finale.
2. All notation programs, owing to the ways they operate, exert some degree of influence on the way composers compose. As early as the 1980s, Finale's *Mass Mover*, *Note Mover*, and MIDI playback features were already influential in shaping the way composers worked on their music.<sup>5</sup> On the one hand, these features may have helped composers save time. On the other hand, their ready availability may have invited overuse.
3. The lack or underdevelopment of certain functionalities may also push composers to work in certain ways rather than others. Finale benefitted from having the flexibility to implement graphical notation, but even then, many of my composer friends found it practical to use external graphical editing programs to further refine their scores.

---

4. See: <https://forums.steinberg.net/t/straight-flags-angle/766503>.

5. For example, watch from 15:20 of <https://youtu.be/T1IRlg87Qks>.

Even from my personal experience using Finale, I encountered situations where I had to devise creative alternatives to meet my notational goals.

These points implicitly highlight the benefits of learning an additional notation program, ideally an open-source one, alongside the program one primarily uses. LilyPond resonated with me most because of its text-based interface, which I have become increasingly familiar with through my involvement in computer programming. As other users have remarked, I have also found it to be very flexible and extensible. All the snippets I list in this document can be reused with relative ease, allowing me to save time in the long run when using specialized notations in my music. This was not necessarily the case when working on the music notation of extended techniques in Finale.

## 0.4 How This Document Is Structured

Each chapter of this document addresses a specific element of music notation, such as noteheads, stems, beams, and so on. Some chapters, however, cover topics specific to LilyPond coding, such as Markups and Spanners. Snippets that use more than one snippet covered in earlier chapters, thus simulating practical applications of these snippets, are covered in the chapter *Combinations*. Snippets that do not appear to belong to earlier chapters find their home in the chapter *Miscellanies*.

Each snippet entry includes a musical example, a description, the relevant grammar, the code required for the snippet to function, and, whenever necessary, a "Discussion" section.

## 0.5 LilyPond Version Used

The version of LilyPond used to create these snippets is 2.24.4.

## 0.6 Acknowledgements

I thank the supportive community of LilyPond users, whose exchanges on `lilypond-user` mailing list have inspired me greatly.

Even though I have not met him, I am grateful to Ben Lemon for his generosity in creating and sharing his LilyPond tutorial videos on YouTube. These videos were immensely helpful during the initial stages of learning LilyPond.

I also want to thank my friends who inspired me to start using LilyPond. It was Cole Ingraham who first introduced me to the program in 2016. My initial attempt at using it was not successful, but more recently, Santiago Beis composed and typeset his orchestral piece *Spletna* entirely in LilyPond, which compelled me to give it another try.

I extend my gratitude to my composition students at the University of Delaware School of Music, with whom I embarked on this journey of learning LilyPond. Even though they were not directly affected by Finale's discontinuation, they remained curious and enthusiastic about exploring this program. I hope that if the programs of their choice ever face a fate similar to Finale (though I sincerely hope they do not), they will be better equipped to adapt without the annoyance and arduous work often associated with transitioning to a new tool.

**[Table of Contents](#)**

# Chapter 1

## Articulations

### 1.1 Jeté (Ricochet)

#### 1.1.1 Description

I use this notation to designate jeté/ricochet for string instruments, adding that the number of bounces are undetermined.<sup>1</sup>

I apply this indication *above* the note regardless of how high or low the note is; however, in case of need, I have supplied the version to be used *under* the note.

#### 1.1.2 Grammar

```
NOTE \jete  
NOTE \jeteUp  
NOTE \jeteDown
```

---

1. Concerning the technique of adding articulation designs to an internal alist, I was inspired by the following thread on lilypond-user mailing list: <https://lists.gnu.org/archive/html/lilypond-user/2015-04/msg00105.html>

## 1.1.3 Code

[Table of Contents](#)

## Chapter 2

# Beams

### 2.1 Wiggle Beam (zig-zag shaped beam)

#### 2.1.1 Description

Ordinary beams are replaced with zig-zag beams. A set of forward then backward beams are printed in the amount specified in the argument. I use this notation in such pieces as *jeux enjeux* (2022) for brass quintet, in order to designate somewhat uneven rhythmic figures, which are nonetheless to be played within the time frame indicated.

`\wiggleBeamOne` replaces an 8<sup>th</sup>-note beam.

`\wiggleBeamTwo` replaces a 16<sup>th</sup>-note beam.

`\wiggleBeamThree` replaces a 32<sup>nd</sup>-note beam.

`\wiggleBeam_markup` adds a zig-zag beam at will. This allows beaming of mixed note durations, such as:

`\wiggleBeamStemAdjust` allows the adjustment of a stem length, in the event the wiggle beam and the stem do not touch each other.

#### 2.1.2 Grammar

`\wiggleBeamOne #vOffset #howMany #width #rotation`

```
\wiggleBeamTwo #vOffset #howMany #width #rotation
\wiggleBeamThree #vOffset #howMany #width #rotation
```

**NB**

- `hOffset` = (`\wiggleBeam_markup` only) the horizontal offset value originating from where the ordinary beam is placed.
- `vOffset` = the vertical offset value originating from where the ordinary beam is placed.
- `howMany` = how many "wiggles" to print. It only accepts integers.
- `width` = how wide each "wiggle" should appear. When in doubt, start with `#1`.
- `rotation` = a positive value would rotate the beam upward, and the negative value would rotate the beam downward.

NOTE `\wiggleBeam_markup #hOffset #vOffset #howMany #width #rotation`

**NB**

- `hOffset` = the horizontal offset value originating from where the ordinary beam is placed.
- `vOffset` = the vertical offset value originating from where an above-staff markup is placed. Thus, `#0` would place a wiggle beam above the staff line.
- `howMany` = how many "wiggles" to print. It only accepts integers.
- `width` = how wide each "wiggle" should appear. When in doubt, start with `#1`.
- `rotation` = a positive value would rotate the beam upward, and the negative value would rotate the beam downward.
- More than one `\wiggleBeam_markup` may be added in sequence, provided that for each instance all the arguments are defined.

```
\wiggleBeamStemAdjust #fromMiddleLine #howFar NOTE
```

**NB**

- `fromMiddleLine` = (`\wiggleBeamStemAdjust` only) = determines one end of the stem, `#0` being the middle line of an ordinary 5-line staff.
- `howFar` = (`\wiggleBeamStemAdjust` only) = computes how long the stem should be extended. A positive value would draw the stem upward, and a negative value would

draw the stem downward. An integer corresponds to the distance between two staff lines of an ordinary 5-line staff.

### 2.1.3 Code

```

1  wiggleBeamOne =
2  #(define-music-function (vOffset howMany howWide howTilted)
3    (number? number? number? number?) #{
4      \once \override Voice.Beam.stencil = #ly:text-interface::print
5      \once \override Voice.Beam.text = \markup {
6        \translate #(cons 0 vOffset)
7        \postscript #(string-append
8          "newpath
9            1 setlinejoin
10           1 setlinecap
11           0.35 setlinewidth
12           0.13 0 moveto "
13         (number->string howMany)
14         " {" (number->string (* 0.6 howWide)) " "
15         (number->string (+ 0.5 howTilted)) " rlineto "
16         (number->string (* 0.6 howWide))
17         " -0.5 rlineto} repeat
18         stroke"
19       )
20
21    }
22    #})
23
24
25  wiggleBeamTwo =
26  #(define-music-function (vOffset howMany howWide howTilted )
27    (number? number? number? number?) #{

158   }

```

#### 2.1.4 Discussion

1. Admittedly, while the current setup allows great flexibility in making the wiggle beams appear, it is entirely possible that some of the parameters be automated.
2. When using many wiggle beams, it may be easier to make the score proportionally notated, in order to avoid the micromanagement of the parameters.

76 grestore")
77         (cons 0 3)
78         (cons 0 1))
79
80 stringPositionClefSize =
81 #(lambda (grob)
82   (let* ((sPCS (ly:grob-property grob 'font-size 0.0))
83         (mult (magstep sPCS)))
84     (ly:stencil-scale
85       stringPositionClef
86       mult mult)))
87

```

```

88 stringPositionClef = {
89   \override Staff.Clef.stencil = \stringPositionClefDesign
90 }
91
92 normalClef = {
93   \revert Staff.Clef.stencil
94 }
95
96 {
97   \override Staff.StaffSymbol.line-positions = #'(6 -6)
98   \override Staff.LedgerLineSpanner.stencil = ##f
99   \override Staff.TimeSignature.stencil = ##f
100  \override Staff.BarLine.stencil = ##f
101  \stringPositionClef c'4 e' g' b' d'' f'' a''
102 }

```

### 3.1.4 Discussion

1. With the current design, `c'` would place a note at the lower end of the fingerboard. `a''` would place a note on the same line as the bridge.
2. The current design comes with the mute sign. If the mute sign is not needed, remove the following portion of the code above:

```

64 %mutesign
65 newpath
66 0.2 setlinewidth
67 1 setlinecap
68 1.5 -2.25 moveto
69 0 -2.5 rlineto
70 0.25 -3.5 moveto
71 2.5 0 rlineto
72 stroke
73 newpath
74 1.5 -3.5 0.85 0 360 arc
75 stroke

```

3. Once `\stringPositionClef` is used, in order to revert back to the normal clef, `\normalClef` must be used.
4. See [Prescriptive Notation for String Instruments](#) for a possible use of this clef.

[Table of Contents](#)

## Chapter 4

# Dynamics

### 4.1 Dynamics in Quotation Marks

#### 4.1.1 Description

Dynamics in quotation marks, also known as *effort dynamics*, indicate those with which certain techniques must be carried on, understanding that the perceived dynamics will be quieter than what are indicated. Examples abound in scores by Helmut Lachenmann and others for such techniques as air sound, bowing directly on the bridge, etc..

#### 4.1.2 Grammar

```
NOTE \qppp  
NOTE \qpp  
NOTE \qp  
NOTE \qmp  
NOTE \qmf  
NOTE \qf  
NOTE \qff  
NOTE \qfff
```

## 4.1.3 Code

```

87 }
```

#### 4.1.4 Discussion

In scores by Lachenmann, in concordance with German quotation marks (*Anführungszeichen*), the opening quotation mark points left, and placed on the bottom line, and the closing quotation mark points right and sits at the top of the last character. It would be possible to achieve this by adjusting the parameters in the Scheme code.<sup>1</sup>

## 5.2 Line as a Notehead

### 5.2.1 Description

These functions replace an ordinary notehead with a dashed or a continuous line. For the continuous line, it is possible to adjust the beginning and ending thicknesses.

### 5.2.2 Grammar

```
\dashedLineNotehead NOTE1 PITCH #x-dist
\modularLineNotehead NOTE1 PITCH #beginningThick #endingThick #x-dist
```

#### NB

1. NOTE1 specifies with which note the line starts. If necessary, the duration must be set, as well.
2. PITCH specifies with which pitch the line ends. Enter only the pitch; this information is used to determine the angle of the line, and it has no effect in displaying the rhythm.
3. x-dist specifies how long the line is.
4. beginningThick (for modularLineNotehead only) specifies how thick the beginning part of the line should be. #15 gives a thin line, similar to the \dashedLineNotehead line. #100 is as thick as a space between two neighboring lines of a staff.
5. endingThick (for modularLineNotehead only) specifies how thick the ending part of the line should be. #15 gives a thin line, similar to the \dashedLineNotehead line. #100 is as thick as a space between two neighboring lines of a staff.

### 5.2.4 Discussion

See [Prescriptive Notation for String Instruments](#) for a possible use of this notehead.

[Table of Contents](#)

### 5.3 Noteheadless

#### 5.3.1 Description

This snippet is hardly my own idea, as I largely quoted this technique from one of the snippets available on LSR.<sup>2</sup> However, I list it here because:

1. it took a while for me to find the workaround for maintaining the musical spacing as a result of omitting noteheads. It is worth noting that because merely disabling `NoteHead.stencil` will render the spacing to be squished, the approach of specifying `##t` for `NoteHead.transparent` (which itself will *not* eliminate the ledger lines) then `##t` for `NoteHead.no-ledgers` is effective in maintaining the general spacing.
2. I use this in conjunction with other notehead alterations, e.g. [Line as a notehead](#).

#### 5.3.2 Grammar

```
\noteheadless NOTE
\noteheadlessOn NOTE
\noteheadlessOff
```

NB

1. `\noteheadless` affects only one note immediately following.
2. For a group of notes, use `\noteheadlessOn` to toggle on the function. `\noteheadlessOff` will toggle off the function.

#### 5.3.3 Code

```
1
2 %% Inspired by:
3 %% http://lsr.di.unimi.it/LSR/Item?id=796
4
5
6 noteheadless = {
7   \once \override Voice.NoteHead.transparent = ##t
8   \once \override Voice.NoteHead.no-ledgers = ##t
```

---

2. See: <http://lsr.di.unimi.it/LSR/Item?id=796>

```
9  }
10
11  noteheadlessOn = {
12    \override Voice.NoteHead.transparent = ##t
13    \override Voice.NoteHead.no-ledgers = ##t
14  }
15  noteheadlessOff = {
16    \revert Voice.NoteHead.transparent
17    \revert Voice.NoteHead.no-ledgers
18  }
19
20
21  {
22    c'4 \noteheadless c'8 d' d'4
23    \noteheadlessOn e'16 f' c' b |
24    \noteheadlessOff d' c' b a
25  }
26
```

## 5.4 Slap Tongue, Type A

### 5.4.1 Description

In my music, I use encircled noteheads to denote slap tongues. Type A, encircled filled notehead, is used for a slap tongue with a regular note immediately following.

### 5.4.2 Grammar

`\slapA NOTE`

**NB** It only affects one note, owing to the `\once \override` functions within the code.

### 5.4.3 Code

```

1  slapA = #(define-music-function (note) (ly:music?)
2      #{ \once \override Voice.NoteHead.stencil =
3          #ly:text-interface::print
4          \once \override Voice.NoteHead.text =
5          \markup {
6              \concat {
7                  \musicglyph "noteheads.s2"
8                  \postscript "newpath
9                      -0.675 0.025 0.75 0 360 arc
10                     closepath stroke"
11              }
12          }
13          $note #})
14
15  {
16      \slapA c'4 \slapA d' \slapA e' \slapA f'
17      \slapA f'' \slapA e'' \slapA d'' \slapA c''
18  }
19
```

[Table of Contents](#)

## 5.5 Slap Tongue, Type B

### 5.5.1 Description

In my music, I use encircled noteheads to denote slap tongues. Type B, encircled hollow notehead, is used for a slap tongue with an air sound immediately following.

### 5.5.2 Grammar

`\SlapB NOTE`

**NB** It only affects one note, owing to the `\once \override` functions within the code.

### 5.5.3 Code

```

1  slapB = #(define-music-function (note) (ly:music?)
2      #{ \once \override Voice.NoteHead.stencil =
3          #ly:text-interface::print
4          \once \override Voice.NoteHead.text =
5          \markup {
6              \concat {
7                  \musicglyph "noteheads.s1"
8                  \postscript "newpath
9                      -0.675 0.025 0.75 0 360 arc
10                     closepath stroke"
11              }
12          }
13      $note #)})
14  {
15      \SlapB c'4 \SlapB d' \SlapB e' \SlapB f'
16      \SlapB f'' \SlapB e'' \SlapB d'' \SlapB c''
17  }
18
```

### 5.5.4 Discussion

As the musical example shows, when the Type B Slap Tongue notehead is applied to a quarter note, it could invite confusion in terms of rhythm. As a slap tongue itself is a

short sound, I only use the slap tongue noteheads on eighth notes or shorter note durations.

[Table of Contents](#)

## 5.6 Slashed Notehead

### 5.6.1 Description

Noteheads with backslashes applied.<sup>3</sup> I use this notehead to indicate, for example, notes on the piano whose strings are prepared, thus producing pitch/sound different from what is expected normally.

### 5.6.2 Grammar

```
\slashNote NOTE
\slashNoteOn NOTE
\slashNoteOff
```

**NB** `\slashNote` only affects one note, owing to the `\once \override` functions within the code. For a group of notes to have slashes applied, use `\slashNoteOn`. `\slashNoteOff` cancels the application.

### 5.6.3 Code

```
1
2 % Inspired by the code provided by Jean Abou Samra
3 % https://lists.gnu.org/archive/html/lilypond-user/2022-11/msg00333.html
4

## 5.8 Tone Cluster

### 5.8.1 Description

Inspired by the tone cluster notation of Henry Cowell and others. See [Discussion](#).

### 5.8.2 Grammar

```
\toneClusterBar NOTE1 NOTE2 yOffset yLengthAdjust
\toneClusterBarHollow NOTE1 NOTE2 yOffset yLengthAdjust
\toneClusterBarWhole NOTE1 NOTE2 yOffset yLengthAdjust
```

NB

1. The order of pitch boundaries as shown by NOTE1 and NOTE2 does not matter; NOTE1 can be upper or lower pitch boundary, and vice versa for NOTE2. See [Code](#).
2. `yOffset` indicates where the upper part of the cluster sign begins. When set to #0, it starts right at the top line of the ordinary 5-line staff. Each positive/negative integer will bring the beginning point up/down by a space of two neighboring lines of the staff.
3. `yLengthAdjust` indicates any value by which the cluster bar may be extended or reduced. When set to #0, the cluster bar will be as long as the distance between the lower boundary of the upper notehead and upper boundary of the lower notehead. Each positive/negative integer will add/reduce the length of the bar by a space of two neighboring lines of the staff.

For this reason, when the tone cluster sign is applied to a quarter-note dyad, you may wish to set the upper part of the cluster bar right in the middle of the notehead. In the snippet shown, the first cluster's `yOffset` is set to #1. `yLengthAdjust` is also set to #1, meaning that the cluster bar will go down to the center of the lower notehead. The second cluster intentionally shows what happens when the bar only touches the two boundaries of the noteheads.

4. `\toneClusterBarHollow` shows the notation (quite à la Cowell) specifically for hollowed noteheads. Some people may prefer this notation, instead.

5. `\toneClusterBarWhole` is specifically for the tone cluster notation as applied to a whole-note dyad, owing to width being wider than the quarter or half noteheads.
6. These functions may be used in tandem with other noteheads, as well as ties. See [Code](#).

### 5.8.3 Code

```

1
2  toneClusterBar =
3  #(define-music-function (note1 note2 yOffset yLengthAdjust)
4    (ly:music? ly:music? number? number?)

```

#### 5.8.4 Discussion

There have been some discussions on `lilypond-user` mailing list in the past that readers may consult for further ideas on implementing different types of tone cluster notation:

- <https://lists.gnu.org/archive/html/lilypond-user/2008-10/msg00484.html> (This one in particular lists other notational conventions established by other composers)
- <https://lists.gnu.org/archive/html/lilypond-user/2020-12/msg00130.html>

[Table of Contents](#)

## 5.9 Tongue Ram (for flute)

### 5.9.1 Description

Implementation of the tongue ram notation, as described in *The Techniques of Flute Playing* by Carin Levine and Christina Mitropoulos-Bott.<sup>4</sup>

### 5.9.2 Grammar

`\tgrWithIndication NOTE`

`\tgr NOTE`

NB

1. `\language "english"` needs to be specified.
2. `\tgr` and `\tgrWithIndication` are followed by a pitch to be fingered on the instrument. The code will copy and reproduce a resultant pitch a major seventh down. Use `\tgrWithIndication` for showing the markup with the indication "T.R." (tongue ram). For more details, see: [FluteExpansions](#).

### 5.9.3 Code

```

1  \tgrWithIndication = #(define-music-function (note1) (ly:music?)
2    (let*      (
3      (p1 #{ #(ly:music-deep-copy note1) \harmonic #})
4      (p2 #{ \transpose c df, #(ly:music-property note1 'pitch)#})
5      (d1 (ly:music-property note1 'duration))
6    )
7    #{ < $p1
8      \single \override NoteHead.stencil = #ly:text-interface::print
9      \single \override NoteHead.text =
10     \markup \musicglyph "noteheads.s2triangle"
11     %\single \override Stem.stencil
12     $p2 > $d1 ^\markup {\override #'(font-size . -2) {[T.R.]} } } #}

```

4. Levine and Mitropoulos-Bott, *The techniques of flute playing = Die Spieltechnik der Flöte*, 28.

```

13     ))
14   tgr = #(define-music-function (note1) (ly:music?)
15     (let*      (
16         (p1 #{ #(ly:music-deep-copy note1) \harmonic #})
17         (p2 #{ \transpose c df, #(ly:music-property note1 'pitch)#})
18         (d1 (ly:music-property note1 'duration))
19       )
20     #{ < $p1
21       \single \override NoteHead.stencil = #ly:text-interface::print
22       \single \override NoteHead.text =
23       \markup \musicglyph "noteheads.s2triangle"
24       %\single \override Stem.stencil
25       $p2 > $d1 #}
26     ))
27
28   {\language "english" \tgrWithIndication d'4-.-> \tgr cs'4-.-> \tgr ef'4-.->}

```

#### 5.9.4 Discussion

I want to improve this code so that I can add markups to the note. It is slightly awkward at the moment.

## 5.10 X In A Hollow Notehead

### 5.10.1 Description

While LilyPond Notation Reference provides an example of an X-in-a-circle notehead, its shape differs from the regular notehead.<sup>5</sup> This implementation simulates a hollow notehead with which the X notehead is combined.

### 5.10.2 Grammar

`\cirX NOTE`

### 5.10.3 Code

```

1  % Stem attachment function inspired by:
2  % https://lsr.di.unimi.it/LSR/Snippet?id=518
3  cirX = #(define-music-function (note) (ly:music?)

## Chapter 7

# Rhythm

### 7.1 Incomplete Tuplet Bracket for Irrational Time Signatures

#### 7.1.1 Description

This entry supplements the irrational time signatures<sup>1</sup> as seen on LSR.<sup>2</sup> Concerning the irrational time signatures, in her *Behind Bars: the Definitive Guide to Music Notation*, Elaine Gould suggests the use of denominator as any division of the semibreve/whole note.<sup>3</sup> However, in these pages there has not been a mention of the use of tuplet brackets while the non-conventional time signature is in place. There are examples, such as *Asyla* for large orchestra by Thomas Adès,<sup>4</sup> where tuplet brackets are placed atop "incomplete" tuplets.

---

1. See [Chapter Time Signatures](#) for discussion on the variants of the irrational/fractional time signatures.

2. <https://lsr.di.unimi.it/LSR/Snippet?id=552>

3. Elaine Gould, *Behind bars : the definitive guide to music notation* (London: Faber Music, 2011), 180–181, Book.

4. Thomas Adès, *Asyla : for large orchestra* (Faber Music, 1997).

While it is still prudent to spend a paragraph explaining the nature of the irrational time signatures in the preface, my preference has also been to utilize incomplete tuplet brackets, in order to allow the reading of the rhythm consistent and smooth from bars with ordinary time signatures. It is also helpful to have the brackets shown in cases of compound time signatures that use irrational time signatures in part (see the first measure of the example).

### 7.1.2 Grammar

```
\incompleteTupletBracket \tuplet ...
\incompleteSmallTupletBracket \tuplet ...
```

#### NB

1. For incomplete tuplets with two or more notes, use `\incompleteTupletBracket`.
2. For incomplete tuplets with one note, use `\incompleteSmallTupletBracket`. This was created specifically to ensure that the brackets appear properly in tight space that one-note tuplet customarily gives.

### 7.1.3 Code

```
1 \version "2.24.4"

60   \incompleteSmallTupletBracket
61   \tuplet 3/2 {c''8} |
62 }

```

### 7.1.4 Discussion

In the preceding code, I have opted to notate the tuplets within the bars with irrational time signatures in an ordinary manner, using `\tuplet`. This is to ensure that the incomplete tuplet bracket appears. Compare this with the quoted LSR No. 552, which has a different way of reducing the note duration in order to fit them into the bar with irrational time signature. Observe the way duration is multiplied by fractions, e.g. Line 6.

```

1  {
2    \time 4/4
3    \tempo 4 = 60
4    fis4 fis fis fis
5    \time 2/6
6    g4*2/3 g |
7    g4*2/3 g |
8    \time 4/5
9    as4*4/5 as as as8*4/5 g |
10   \tuplet 3/2 { as4*4/5 as as } as4*4/5 as8*4/5 g |
11   \time 3/7
12   fis4*4/7 fis fis |
13   fis4*4/7 fis fis |
14 }
```

## Chapter 8

# Spanners

This chapter covers snippets that take advantages of spanners (text, line, etc.) in one way or another. Because functions such as `\startTextSpan` and `\stopTextSpan` activate and deactivate these snippets, caution must be paid when using more than one of them at the same time. See [Example in Combinations](#) to avoid conflicts between or among the spanner snippets.

### 8.1 Grace Note Brackets

#### 8.1.1 Description

Replication of grace note brackets seen in scores by Pierre Boulez (e.g. *Sur Incises*,<sup>1</sup> *...explosante-fixe...*<sup>2</sup>). Bracket A in the example shows that the grace notes are to be played *before* the beat to which they are applied. Whereas Bracket B shows that the grace notes are to be played *on* the beat to which they are applied.

---

1. Pierre Boulez, *Sur incises : pour trois pianos, trois harpes et trois percussions-claviers* (1996/1998) (Universal Edition, 1998).

2. Pierre Boulez, *... explosante-fixe ... transitoire VII : (version 1991/93)* (Universal Edition, 1991).

### 8.1.2 Grammar

```
\graceNoteBeforeBeatOn NOTE
\graceNoteBeforeBeatOff NOTE
\graceNoteAfterBeatOn NOTE
\graceNoteAfterBeatOff NOTE
```

## 8.2 Tempo Arrows

### 8.2.1 Description

Replication of accelerando and rallentando arrows chiefly seen in scores by Tōru Takemitsu.<sup>3</sup> The snippets also handle line break.

### 8.2.2 Grammar

```
\accelArrow #Line_angle ... \stopTextSpan
\rallArrow #Line_angle ... \stopTextSpan
```

NB

1. `#Line_angle` sets how angled the horizontal line should be. `#5` should be more than sufficient for a short line. When it goes over a line break or it extends for a long time, a smaller number may be recommended, such as `#2`.

---

3. Examples abound, but see: Tōru Takemitsu, *Fantasma/cantos : for clarinet and orchestra* (Schott ; Schott Japan, 1993) and Tōru Takemitsu, *Les yeux clos II : for piano* (Schott ; Schott Japan, 1990) Other composers from the same publishing company, e.g. Toshio Hosokawa, have also adopted variants of the arrows in their music.

2. These commands only set the tempo arrows; as such, indications such as `accel.` and `rall.` need to be added separately.

### 8.2.3 Code

# Chapter 10

## Stems

### 10.1 "M" on Stem

#### 10.1.1 Description

This function attaches "M" to the stem. I have used this to indicate **M**ultiphonics on woodwind instruments in my pieces. This function lengthens the stem in order to give a balanced look, especially combined with stems/flags.

#### 10.1.2 Grammar

```
\MOnStemOn NOTE ...  
\MOnStemOff
```

**NB** `\MOnStemOn` toggles the feature on, while `\MOnStemOff` toggles it off.

#### 10.1.3 Code

```
1 MOnStemOn = {  
2   \override Stem.length = #12  
3   \override Stem.details.beamed-lengths = #'(5.5)  
4   \override Stem.stencil =  
5   #(lambda (grob)
```

```

6      (let* ((x-parent (ly:grob-parent grob X))
7             (is-rest? (ly:grob? (ly:grob-object x-parent 'rest))))
8      (if is-rest?
9          empty-stencil
10         (ly:stencil-combine-at-edge
11          (ly:stem::print grob)
12          Y
13          (- (ly:grob-property grob 'direction))
14          (grob-interpret-markup grob
15              (markup
16                  #:center-align
17                  #:teeny #:sans #:bold "M"))
18          -3.5))))
19  }
20
21  MOnStemOff = {
22    \revert Stem.length
23    \revert Stem.details.beamed-lengths
24    \revert Stem.stencil
25    \revert Flag.stencil
26  }
27
28  {
29    \MOnStemOn c'4 g' \MOnStemOff d'' a''
30    \MOnStemOn a'' d'' \MOnStemOff g' c'
31  }

```

[Table of Contents](#)

## 10.2 "S" on Stem

### 10.2.1 Description

This function attaches "S" to the stem. I have used this to indicate **Split** tone on clarinet/bass clarinet in my pieces. This function lengthens the stem in order to give a balanced look, especially combined with stems/flags.

### 10.2.2 Grammar

```
\SOnStemOn NOTE ...
\SOnStemOff
```

**NB** `\SOnStemOn` toggles the feature on, while `\SOnStemOff` toggles it off.

### 10.2.3 Code

```
1  SOnStemOn = {
2    \override Stem.length = #12
3    \override Stem.details.beamed-lengths = #'(5.5)
4    \override Stem.stencil =
5    #(lambda (grob)
6      (let* ((x-parent (ly:grob-parent grob X))
7              (is-rest? (ly:grob? (ly:grob-object x-parent 'rest))))
8        (if is-rest?
9            empty-stencil
10           (ly:stencil-combine-at-edge
11             (ly:stem::print grob)
12             Y
13             (- (ly:grob-property grob 'direction))
14             (grob-interpret-markup grob
15               (markup
16                 #:center-align
17                 #:teeny #:sans #:bold "S"))
18             -3.5))))
19  }
20
```

```
21 SOnStemOff = {
22     \revert Stem.length
23     \revert Stem.details.beamed-lengths
24     \revert Stem.stencil
25     \revert Flag.stencil
26 }
27
28 {
29     \SOnStemOn c'4 g' \SOnStemOff d'' a''
30     \SOnStemOn a'' d'' \SOnStemOff g' c'
31 }
```

[Table of Contents](#)

### 10.3 "V" on Stem

#### 10.3.1 Description

This function attaches "V" to the stem. I have used this to designate a note with a differentiated timbre from others, for example "brassy tone" for bassoon in my *Gz III* (2019-21) for bass clarinet and bassoon. This function lengthens the stem in order to give a balanced look, especially combined with stems/flags.

#### 10.3.2 Grammar

```
\VOnStemOn NOTE ...
\VOnStemOff
```

**NB** `\VOnStemOn` toggles the feature on, while `\VOnStemOff` toggles it off.

#### 10.3.3 Code

```
1  VOnStemOn = {
2    \override Stem.no-stem-extend = ##f
3    \override Stem.length = #12
4    \override Stem.details.beamed-lengths = #'(5.5)
5    \override Stem.stencil =
6    #(lambda (grob)
7      (let* ((x-parent (ly:grob-parent grob X))
8              (is-rest? (ly:grob? (ly:grob-object x-parent 'rest))))
9        (if is-rest?
10           empty-stencil
11           (ly:stencil-combine-at-edge
12             (ly:stem::print grob)
13             Y
14             (- (ly:grob-property grob 'direction))
15             (grob-interpret-markup grob
16               (markup
17                 #:center-align
18                 #:teeny #:sans #:musicglyph "scripts.upbow")))
19             -3.5))))
```

```
20  }
21
22  VOnStemOff = {
23      \revert Stem.length
24      \revert Stem.stencil
25      \revert Flag.stencil
26  }
27
28
29  {
30      \VOnStemOn c'4 g' \VOnStemOff d'' a''
31      \VOnStemOn a'' d'' \VOnStemOff g' c'
32  }
```

## Chapter 11

# Time Signatures

First nine entries of this chapter discuss fractional time signatures (variants of the irrational time signatures) and their compound forms. I have been inspired to create these implementations after chancing upon the email exchanges on `lilypond-user` dated from 2014.<sup>1</sup>

While Gould discourages the use of time signatures with numerators as fractions,<sup>2</sup> there are cases where the use of such time signatures seems justified, particularly when the fractions deal with some form of tuplets. This is a form of time signature notation widely seen in works by Chaya Czernowin, Stefan Beyer, myself, and so many others.

I present the implementation of fractional time signatures in three different styles, A, B, and C. There are implementations for compound meters for each of the styles, in two and three time signatures.

### 11.1 Fractional Time Signatures, Style A

1. See: <https://lists.gnu.org/archive/html/lilypond-user/2014-06/msg00209.html>. However, in the process of writing this documentation I have come across another email thread on the same mailing list: <https://mail.gnu.org/archive/html/lilypond-user/2020-04/msg00423.html>

2. Gould, *Behind bars : the definitive guide to music notation*, 180.

### 11.1.1 Description

This particular style of fractional time signatures<sup>3</sup> can be seen in scores by Stefan Beyer, for example *Marsch* (2013-14),<sup>4</sup> *Mittel und Zwecke (Boulevard)* (2014),<sup>5</sup> *Bleib hier. Schau zu. Mach kein Geräusch.* (2017),<sup>6</sup> and *Most of My Clients Come Back* (2012-13).<sup>7</sup> In the case of *Mass und Gewicht* (2021), Beyer uses fractions on the denominator of the time signatures.<sup>8</sup>

Because the size the fractions is a half of the ordinary time signatures, it may be difficult to see from afar.<sup>9</sup>

### 11.1.2 Grammar

```
\fractionalTimeSignatureA
    #'(NUM1 NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureA
    #'(NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureAPlus
    #'(NUM1 NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureAPlus
    #'(NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
```

### NB

3. After having come up with this code, there were other implementations that could be seen on this email thread: <https://mail.gnu.org/archive/html/lilypond-user/2020-04/msg00423.html>

4. Stefan Beyer, *Marsch* (Manuscript, 2013-14).

5. Stefan Beyer, *Mittel und Zwecke (Boulevard)* (Manuscript, 2014).

6. Stefan Beyer, *Bleib hier. Schau zu. Mach kein Geräusch.* (Manuscript, 2017).

7. Stefan Beyer, *Most of My Clients Come Back* (Manuscript, 2012-13).

8. It would be relatively easy to modify the Scheme code so that the fraction appears next to the denominator of the time signature, instead.

9. It should be noted that in other works such as *Lotte Reiniger's The Sleeping Beauty* (2020-21), Beyer also uses the irrational time signatures as seen in the [Incomplete Tuplet Bracket for Irrational Time Signatures](#) section of this document.

1. `\fractionalTimeSignatureA` lists time signatures *without* the use of the + (plus) sign.
2. `\fractionalTimeSignatureAPlus` lists time signatures with the + (plus) sign, when the list with four NUMs are given.
3. NUM1, NUM2, NUM3, and NUM4 can be understood as follows:

$$\frac{1 + \frac{2}{3}}{4}$$

where NUM1 is optional. The code has `cond` clause, which adjusts the appearance of the time signature according to the length of the list, either having 3 or 4 numbers.

4. `MEASURE_SPAN` denotes how the measure may be written using an *irrational time signature*. In the example snippet, this would be:

$$\frac{3}{4} + \frac{2}{12} = \frac{11}{12}$$

5. `BEAT_STRUCT` indicates beat structure, by which the beaming of the measure abides.

[Table of Contents](#)

## 11.2 Fractional Time Signatures, Style B

### 11.2.1 Description

Style B differs from Style A, as the fraction has a bigger font size. This is similar to the design of fractional time signatures I have used in works such as *Gz II* (2017-22).<sup>10</sup>

### 11.2.2 Grammar

```
\fractionalTimeSignatureB
    #'(NUM1 NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureB
    #'(NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureBPlus
    #'(NUM1 NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureBPlus
    #'(NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
```

NB

1. `\fractionalTimeSignatureB` lists time signatures *without* the use of the + (plus) sign.
2. `\fractionalTimeSignatureBPlus` lists time signatures with the + (plus) sign, when the list with four NUMs are given.
3. See [Grammar of Fractional Time Signatures, Style A](#) for the explanation on the arguments.

---

10. Yoshiaki Onishi, *Gz II : for two accordions* (Brühl and Berlin: Edition Gravis, 2024).

### 11.3 Fractional Time Signatures, Style C

#### 11.3.1 Description

Style C of the fractional time signatures offers the largest font size for displaying the fractions. This design is commonly seen in scores by Chaya Czernowin, in such works as *String Quartet* (1995),<sup>11</sup> *Lovesong* (2010),<sup>12</sup> *Streams (Slow Summer Stay I)* (2012),<sup>13</sup> and *At the fringe of our gaze* (2012/13).<sup>14</sup>

#### 11.3.2 Grammar

```
\fractionalTimeSignatureC
    #'(NUM1 NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
\fractionalTimeSignatureC
    #'(NUM2 NUM3 NUM4) MEASURE_SPAN BEAT_STRUCT
```

#### NB

1. By default, `\fractionalTimeSignatureC` shows + (plus) sign when four NUMs are given. As the font size for the ordinary numerator and the fractions is the same, without + it becomes very confusing to read the time signature. Thus, contrary to Styles A and B, there is no separate function for the time signature with the + sign given.
2. See [Grammar of Fractional Time Signatures, Style A](#) for the explanation on the arguments.

11. Chaya Czernowin, *String Quartet* (Schott, 1995).

12. Chaya Czernowin, *Lovesong : for mixed ensemble* (Schott, 2010).

13. Chaya Czernowin, *Streams (Slow Summer Stay I) : for 8 players* (Schott, 2012).

14. Chaya Czernowin, *At the fringe of our gaze : for Orchestra and Concertino Group* (Schott, 2012/13).

## 11.4 Compound Meter with Two Fractional Time Signatures, Style A

### 11.4.1 Description

This is an implementation of a compound meter with two fractional time signatures with Style A.

### 11.4.2 Grammar

```
\compoundFractionalTimeSignatureATwo
  #'((TIME_SIG1)(TIME_SIG2)) MEASURE_SPAN BEAT_STRUCT
```

#### NB

1. Following the convention of `\compoundMeter` to enter the two time signatures, you will create a list of lists. Each `TIME_SIG` accepts:

- an ordinary time signature (list with two numbers),
- a time signature with a fraction (list with three numbers), or:
- a time signature with an ordinary numerator and a fraction.

See [Grammar of Fractional Time Signatures, Style A](#) for the explanation on the arguments for the order of arguments to specify time signatures.

2. `MEASURE_SPAN` and `BEAT_STRUCT` follow the same convention as before.

### 11.4.3 Code

```
1 \version "2.24.4"
2 \language "english"

#### 11.4.4 Discussion

1. This was a tricky one to make, as I had to resort to building the Scheme code without using the syntactic sugars, i.e. `#:`.<sup>15</sup> If any modification are to be made to this code, it is recommended to carefully examine where the corresponding parenthesis of a starting parenthesis is located. It is also helpful to watch LilyPond Log for any errors, as it seems to give hints for how many argument(s) a function is looking for.
2. I am hoping to find ways to simplify the code, as the same bits (with variations in variables that are called upon) of the codes are used to streamline the formatting of the time signature appearances.

## 11.5 Compound Meter with Two Fractional Time Signatures, Style B

### 11.5.1 Description

This is an implementation of a compound meter with two fractional time signatures with Style B.

### 11.5.2 Grammar

```
\compoundFractionalTimeSignatureBTwo
  #'((TIME_SIG1)(TIME_SIG2)) MEASURE_SPAN BEAT_STRUCT
```

NB

1. Following the convention of `\compoundMeter` to enter the two time signatures, you will create a list of lists. Each `TIME_SIG` accepts: an ordinary time signature (list with two numbers), a time signature with a fraction (list with three numbers), or a time signature with an ordinary numerator and a fraction. See [Grammar of Fractional Time Signatures, Style A](#) for the explanation on the arguments for the order of arguments to specify time signatures.
2. `MEASURE_SPAN` and `BEAT_STRUCT` follow the same convention as before.

### 11.5.3 Code

## 11.6 Compound Meter with Two Fractional Time Signatures, Style C

### 11.6.1 Description

This is an implementation of a compound meter with two fractional time signatures with Style C.

### 11.6.2 Grammar

```
\compoundFractionalTimeSignatureCTwo
  #'((TIME_SIG1)(TIME_SIG2)) MEASURE_SPAN BEAT_STRUCT
```

#### NB

1. Following the convention of `\compoundMeter` to enter the two time signatures, you will create a list of lists. Each `TIME_SIG` accepts: an ordinary time signature (list with two numbers), a time signature with a fraction (list with three numbers), or a time signature with an ordinary numerator and a fraction. See [Grammar of Fractional Time Signatures, Style A](#) for the explanation on the arguments for the order of arguments to specify time signatures.
2. `MEASURE_SPAN` and `BEAT_STRUCT` follow the same convention as before.

## 11.7 Compound Meter with Three Fractional Time Signatures, Style A

### 11.7.1 Description

This is an implementation of a compound meter with three fractional time signatures with Style A.

### 11.7.2 Grammar

```
\compoundFractionalTimeSignatureAThree
#'((TIME_SIG1)(TIME_SIG2)(TIME_SIG3)) MEASURE_SPAN BEAT_STRUCT
```

NB

1. Following the convention of `\compoundMeter` to enter the two time signatures, you will create a list of lists. Each `TIME_SIG` accepts:
  - an ordinary time signature (list with two numbers),
  - a time signature with a fraction (list with three numbers),
  - or; a time signature with an ordinary numerator and a fraction.

See [Grammar of Fractional Time Signatures, Style A](#) for the explanation on the arguments for the order of arguments to specify time signatures.

2. In the code of the given snippet, the value for `MEASURE_SPAN` may appear absurd. However, this results from following the same convention as before, i.e. adding the constituent time signatures to give a general irrational time signature for the entire bar. Thus:

$$\frac{3}{4} + \frac{4}{20} + \frac{2}{12} = \frac{67}{60}$$

3. `BEAT_STRUCT` follows the same convention as before; however, as the given code shows, it may be necessary to still use `[` and `]` to explicitly specify the beaming.

```

#### 11.7.4 Discussion

1. As mentioned in the **Grammar** section, it appears that specifying the beaming in the LilyPond code is still necessary. This is probably because of the unusual value of the fraction that needs to be given in the second argument of the function, `MEASURE_SPAN`.
2. As in the case of the other compound meters introduced in this document, I am hoping to find ways to simplify the code.

[Table of Contents](#)

## 11.8 Compound Meter with Three Fractional Time Signatures, Style B

### 11.8.1 Description

This is an implementation of a compound meter with three fractional time signatures with Style B.

### 11.8.2 Grammar

```
\compoundFractionalTimeSignatureBThree
  #'((TIME_SIG1)(TIME_SIG2)(TIME_SIG3)) MEASURE_SPAN BEAT_STRUCT
```

NB

1. See [Grammar](#) of the entry *Compound Meter with Three Fractional Time Signatures, Style A*.

## 11.9 Compound Meter with Three Fractional Time Signatures, Style C

### 11.9.1 Description

This is an implementation of a compound meter with three fractional time signatures with Style C.

### 11.9.2 Grammar

```
\compoundFractionalTimeSignatureCThree
    #'((TIME_SIG1)(TIME_SIG2)(TIME_SIG3)) MEASURE_SPAN BEAT_STRUCT
```

NB

1. See [Grammar](#) of the entry *Compound Meter with Three Fractional Time Signatures, Style A*.

# Chapter 12

## Combinations

This chapter presents examples that combine several snippets from the previous chapters. **Variables Used** provides a comprehensive list of all the variables required to generate the snippet. Among these, indented variables indicate "variables of a variable," i.e., dependent variables necessary for the main variables to function. The **Code** section only lists the score portion of the LilyPond code.

### 12.1 Prescriptive Notation for String Instruments

#### 12.1.1 Description

An example of a prescriptive notation for a string instrument. Vertical placement of the notehead corresponds to the position at which bowing takes place. Horizontally it shows the change of the bow pressure against the string(s).

#### 12.1.2 Variables Used

```
\strPosClef
\strPosClefDesign
\strPosClefSize
```

```

\dashedLineNotehead
\modularLineNotehead
\noteheadless

```

### 12.1.3 Code

```

## 12.2 Multiple Instances Of Spanners At Once

Two musical staves, A and B, illustrating multiple instances of spanners. Both staves show a tempo change from 100 to 50 (rall.) and a 3-measure grace note before a beat. Staff A shows a single instance of the spanner, while Staff B shows two instances, one for each staff line.

### 12.2.1 Description

Invoking two or more Text Spanners (that require `\stopTextSpan` for them to finish their processes) all on one single layer could cause the spanners to behave unexpectedly. This entry is an attempt to avoid such unexpected behaviors by invoking a spanner per layer (A), or per staff line (B).

### 12.2.2 Variables Used

```
\startSlashedGraceMusic
\stopSlashedGraceMusic
\graceNoteBeforeBeatOn
\graceNoteBeforeBeatOff
\graceNoteAfterBeatOn
\graceNoteAfterBeatOff
\rallArrow
```

## 12.2.3 Code

```

## Chapter 14

# Exploring Scheme

### 14.1 Introduction

Scheme, one of the dialects of the Lisp family of programming languages, is used in LilyPond as its extension language. Scheme allows LilyPond users to explore the inner workings of the program, enabling significant customization. The snippets in this document would not exist without taking advantage of it.<sup>1</sup>

However, learning Scheme can be daunting. In his unfinished book on Scheme and LilyPond, Urs Liska refers to its "thorny path."<sup>2</sup> While I have experience with Common Lisp (another Lisp dialect) from my work with OpenMusic, adjusting to Scheme's grammatical nuances still took some time.

This chapter does not aim to be a comprehensive guide to using Scheme in LilyPond.<sup>3</sup> Instead, it offers suggestions for newcomers to familiarize themselves with Scheme.

#### 14.1.1 Step 1a: Focus on the Scheme Language Itself

Scheme is a language distinct from LilyPond, and understanding this distinction is essential. For simpler LilyPond tasks, Scheme may not be necessary. However, when working with internal parameters, Scheme allows deeper customization. It is beneficial to first study Scheme independently, learning its syntax and concepts by writing simple code.

---

1. For newcomers: parts of LilyPond code written in Scheme are often enclosed in `#(` and `)`. Numerical values preceded by `#`, and number pairs such as `\#' (1 . -2)`, are also part of the Scheme language.

2. Urs Liska, *Understanding Scheme In LilyPond*, vol. 2024, December 19 (2020), Web Page, <https://scheme-book.readthedocs.io/en/latest/>.

3. For a deeper dive, refer to the resource by Liska, as well as Jean Abou Samra, *Extending LilyPond*, vol. 2024, December 19 (2021), Web Page, <https://extending-lilypond.gitlab.io/en/index.html>. LilyPond also provides its own Extending Manual: <https://lilypond.org/doc/v2.24/Documentation/extending/index>

### 14.1.2 Step 1b: Get Used to Prefix Notation

Scheme, like its Lisp relatives, uses prefix notation (Cambridge Polish Notation). Here are examples:

```
(+ 12 34)
```

>> This expression results in the value of 46.

```
(+ 4 (* 3 9))
```

>> This expression first resolves the multiplication: (+ 4 27), which is 31.

If you are new to this, I recommend starting with Daniel P. Friedman and Matthias Felleisen, *The little Schemer (4th ed.)* (Cambridge, MA, USA: MIT Press, 1996), ISBN: 0262560992. While you might be eager to dive into using Scheme in LilyPond, learning Scheme as a programming language will make the process smoother.<sup>4</sup>

### 14.1.3 Step 2: Study Lots of Snippets

Once familiar with Scheme, study how it integrates with LilyPond by reviewing snippets from LSR. Start with shorter examples and analyze their structure. Here is an example snippet for adding the *Schleifer* ornament:<sup>5</sup>

The corresponding code:<sup>6</sup>

```
1 % Implementation by Martin Straeten of the Schleifer ornament
2 % as used by Johann Sebastian Bach, contributed to the user
3 % mailing list. In this case, it functions like a set of (always?)
4 % two grace notes, hence using a modified grace note to represent
5 % it in LilyPond makes sense.
6 %
7 % Code styling and user interface by Simon Albrecht 2024.
8
9 schleiferMarkup = \markup {
10   \large \halign #.2 \raise #0.0
```

4. Liska and Samra's resources serve as excellent refreshers later on.

5. <https://lsr.di.unimi.it/LSR/Item?id=1185>

6. The mailing list thread referenced in the preamble is available at <https://lists.gnu.org/archive/html/lilypond-user/2021-09/msg00352.html>

```

11  \combine
12  \halign #.8 \musicglyph "scripts.prall"
13  \rotate #140 \normalsize \raise #2.4 \musicglyph "flags.u3"
14  }
15  schleiferGrace =
16  #(define-music-function (note) (ly:music?)
17    #{
18      \grace {
19        \once\override NoteHead.stencil = #ly:text-interface::print
20        \once\override NoteHead.X-extent = #'(-2 . -0)
21        \once\override NoteHead.text = \schleiferMarkup
22        \once\omit Stem
23        \once\omit Flag
24        $note
25      }
26    #})
27
28  \relative {
29    \time 3/8
30    \partial 8
31    \clef bass
32    \key c \minor
33    g8
34    \schleiferGrace c es8. d16 c8
35    c4
36  }
37  \addlyrics {
38    Ich ha -- be ge -- nug
39  }

```

The `\schleiferGrace` variable creates a customized ornament using Scheme's `define-music-function` macro. For a deeper understanding of the macro syntax, refer to the *LilyPond – Internals Reference*.<sup>7</sup>

Taking the variable `\schleiferGrace`, we see that invoking it creates an instance of activating a Scheme function that starts at Line 16. `define-music-function` is a macro that allows you to create a function that operates on LilyPond. According to Chapter 4: Scheme Functions in *LilyPond – Internals Reference*,<sup>8</sup> the syntax for `define-music-function` is:

---

7. <https://lilypond.org/doc/v2.24/Documentation/internals/scheme-functions>

8. [https://lilypond.org/doc/v2.24/Documentation/internals/scheme-functions#index-define\\_002dmusic\\_002dfunction](https://lilypond.org/doc/v2.24/Documentation/internals/scheme-functions#index-define_002dmusic_002dfunction)

```
(define-music-function (arg1 arg2 ...)
  (type1? type2? ...)
  function-body)
```

In the code, the argument's name is `note`, and it is tested according to the type specified in `type1?`, which in this case is `ly:music?`. According to the *Internal Reference*, `ly:music?` is a function that checks whether the object—in this case, `note`—is a `Music` object. Thus, it becomes clear that this function will not work unless it is followed by a musical note.

From Line 17 to Line 26, we see that a LilyPond code snippet has been inserted, as `#{` and `#}` signify the boundary of the LilyPond code within the Scheme code. This means that as part of invoking the variable `\schleiferGrace`, it passes through this LilyPond fragment, which is responsible for creating a grace note. Here, the notehead of the grace note is replaced with `\schleiferMarkup`, which is defined in Lines 9 to 14 of the code.<sup>9</sup>

Lines 22 and 23 show that the stem and flag are omitted from the grace note, while Line 24's `$note` signifies that the original argument `note` is called upon.<sup>10</sup> In this way, the *Schleifer* ornament is created from a note that follows the variable `\schleiferGrace`. This note is transformed into a grace note with a customized stencil setting, all done within the Scheme code.

#### 14.1.4 Step 3: Hack the Codes

Once you study a code and become familiar with how it operates, experimenting with the code by hacking is a good way to deepen your understanding. Below, I give one example using the preceding *Schleifer* ornament snippet.

The *LilyPond – Internal Reference* reveals that the object `NoteHead` has its own standard settings, as well as support for about a dozen other interfaces.<sup>11</sup> One of them is the `grob-interface`, which makes it possible to change the color of a graphical object, or *Grob*.<sup>12</sup> Further reading in the *LilyPond – Notation Reference* shows that it is possible to override the color of an object.<sup>13</sup> Let us now tweak the *Schleifer* ornament code to allow us to change the ornament's color.

Following the reference, add the following line underneath `\once\override NoteHead.X-extent:`

---

9. The technique of sequential overrides, invoking the Scheme command `#ly:text-interface::print`, sets the `.stencil` of the notehead to use whatever is defined in the `.text` parameter. This technique is frequently used and is very useful in customizing notation. See also: <https://lilypond.org/doc/v2.24/Documentation/notation/modifying-stencils>.

10. Refer to this page for the difference between `#` and `$`: <https://lilypond.org/doc/v2.24/Documentation/extending/lilypond-scheme-syntax>

11. <https://lilypond.org/doc/v2.24/Documentation/internals/notehead>

12. [https://lilypond.org/doc/v2.24/Documentation/internals/grob\\_002dinterface](https://lilypond.org/doc/v2.24/Documentation/internals/grob_002dinterface)

13. <https://lilypond.org/doc/v2.24/Documentation/notation/inside-the-staff#coloring-objects>

```
\once\override NoteHead.color = #red
```

Running LilyPond now should produce the following result:

Hard-coding a change like this may be good for testing the waters, but we may want the *Schleifer* ornament in more than just one color. The beauty of extending LilyPond is that we can customize the Scheme code to allow for this flexibility.

Let us move on. We should now let the `define-music-function` know that we are adding an additional argument to specify the color. The first part of the code will look like this:

```
#{(define-music-function (note schleiferColor) (ly:music? color?)
```

This adds the argument `schleiferColor`, which only accepts color, as indicated by the corresponding test function `color?`.

Then, implement this argument in the sequence of `\once\override` processes. The line `NoteHead.color` can now be changed to:

```
\once\override NoteHead.color = #schleiferColor
```

Now, the variable `\schleiferGrace` requires one more argument to specify the ornament's color. The entire code should look like this:

```
1  schleiferMarkup = \markup {
2    \large \halign #.2 \raise #0.0
3    \combine
4    \halign #.8 \musicglyph "scripts.prall"
5    \rotate #140 \normalsize \raise #2.4 \musicglyph "flags.u3"
6  }
7
8  schleiferGrace =
9  #{(define-music-function (note schleiferColor) (ly:music? color?)
10    #{
11      \grace {
12        \once\override NoteHead.stencil = #ly:text-interface::print
13        \once\override NoteHead.X-extent = #'(-2 . 0)
14        \once\override NoteHead.color = #schleiferColor
15        \once\override NoteHead.text = \schleiferMarkup
```

```

16      \once\omit Stem
17      \once\omit Flag
18      $note
19      }
20      #})
21      \relative {
22        \time 3/8
23        \partial 8
24        \clef bass
25        \key c \minor
26        g8
27        \schleiferGrace c #green es8. d16 c8
28        c4
29      }
30      \addlyrics {
31        Ich ha -- be ge -- nug
32      }

```

This produces the following output:

Notice that on Line 27, `#green` has been added. You can change this to any of the colors listed under "Normal Colors" in the *Notation Reference*,<sup>14</sup> such as `#'"lightsalmon"`, `#(x11-color "medium turquoise")`, or even `#'"#5e45ad"`.

As an exercise, try replicating the following excerpt:<sup>15</sup>

**NB** – In subsequent version updates of this document, I will add examples of Scheme code-heavy snippets.
